```

Symbol

DrawPauliTransferMap[map] visualises the given PTMap as a graph where nodes
are basis Pauli strings, and edges indicate the transformative action of the map.
DrawPauliTransferMap also accepts PTM, circuit and gate
instances, for which the corresponding PTMap is automatically calculated.
DrawPauliTransferMap accepts options "PauliStringForm", "ShowCoefficients"
and "NodeDegreeEdgeStyles", in addition to all options accepted by Graph[].
• "ShowCoefficients" –> False hides the map's
Pauli string coefficients which are otherwise shown as edge labels.
• "PauliStringForm" sets the vertex label format to one of "Subscript" (default), "Index",
"Kronecker" or "String". These are the formats supported by GetPauliStringReformatted[].
• "NodeDegreeEdgeStyles" specifies a list of styles (default informed by
ColorData["Rainbow"]) to set upon edges from nodes with increasing outdegree.
For example, "NodeDegreeEdgeStyles"–>{Red,Green,Blue} sets edges from
Pauli states which are mapped to a single other state to the colour Red, but
two–outdegree node out–edges become Green, and three–outdegree become
Blue. The list is assumed repeated for higher outdegree nodes than specified.
• Graph[] options override these settings, so specifying EdgeStyle
–> Black will set all edges to Black regardless of their node's outdegree.

Correctness

PTMap

```
map = CalcPauliTransferMap @ Rz0[x]
DrawPauliTransferMap[map]
```

```
PTMap0[0 → {{0, 1}}, 1 → {{1, Cos[x]}, {2, Sin[x]}},
 2 → {{1, -Sin[x]}, {2, Cos[x]}}, 3 → {{3, 1}}]
```

```
DrawPauliTransferMap @ CalcPauliTransferMap @ Damp4[x]
```
