? GetPauliString

Symbol

Returns a Pauli string or a weighted sum of symbolic Pauli tensors from a variety of input formats.

GetPauliString[matrix] returns a complex–weighted sum of Pauli tensors equivalent to the given matrix. If the input matrix is Hermitian, the output can be passed to Chop[] in order to remove the negligible imaginary components.

GetPauliString[index] returns the basis Pauli string corresponding to the given index, where the returned Pauli operator targeting 0 is informed by the least significant bit(s) of the index.

GetPauliString[address] opens or downloads the file at address (a string, of a file location or URL), and interprets it as a list of coefficients and Pauli codes. Each line of the file is assumed a separate Pauli tensor with format {coeff code1 code2 ... codeN} (excluding braces) where the codes are in {0,1,2,3} (indicating a I, X, Y, Z), for an N-qubit Pauli string, and are given in order of increasing significance (zero qubit left). Each line must have N+1 terms, which includes the initial real decimal coefficient. For an example, see "https://qtechtheory.org/hamil_6qbLiH.txt".

GetPauliString[..., numQubits] overrides the inferred number of qubits, introducing additional Id operators upon un–targeted qubits (unless explicitly removed with "Removelds"–>False).

GetPauliString[..., {targets}] specifies a list of qubits which the returned Pauli string should target (in the given order), instead of the default targets {0, 1, 2, ...}.

GetPauliString accepts optional argument "Removelds" -> True or False

(default Automatic) which when True, retains otherwise removed Id operators
so that the returned string has an explicit Pauli operator acting upon every qubit.
